## AutoCAD Torrent (Activation Code)

Q: "Cannot assign to variable" error when declaring local variable within function I am working with Python and have been working on some basic code to learn how to manipulate strings in a list. I am creating a function that takes the list input and returns a list of all the unique strings (using the set command), remove all the duplicate strings (using the set command), remove all the non-alphabetical characters (using the set command) and then print out the results. I have the functions working, but I get the error: "unable to assign to variable" when trying to declare the local variable result. I have tried every permutation of declaring a variable as global, local, and multiple. I cannot get the variable to be able to define it. I have also tried to look up other questions on the same topic. Here is my code: `import string def dedupe_chars(title): "" title - a string containing the list of characters "" result = [] set_title = set(title) for string in set_title: if string in 'ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz': result.append(string) else: pass return result def dedupe_numbers(title): "" title - a string containing the list of numbers "" set_title = set(title) for string in set_title: if string in '0123456789': result.append(string) else: pass return result def dedupe_special_characters(title): "" title - a string containing the list of special characters "" set_title = set(title)`

## What's New In AutoCAD?

Add a new icon style, tool, or command to an existing icon style. Export an icon style from a drawing as a ZIP file or download as an SVG or PNG. (video: 2:23 min.) Use drag and drop to move block objects in an illustration from one place to another. When moving a block object, you can: Drag and drop the object anywhere in your drawing Drag and drop the object into a group Drag and drop the object into a layer Save your last pen stroke, and continue where you left off. With the latest updates to the Penstroke component, the Pen Stroke History feature now has: Automatic capture of a user-specified number of pen strokes Enumeration of Pen Strokes Option to save the last pen stroke Share pen strokes Save pen strokes by clicking a button or shortcut If you've been building in the AutoCAD 2023 beta, you'll notice a few new features, such as enhanced gesture recognition and additional mapping tools. These updates have been rolled out to all AutoCAD users. Creating and Modifying Block Styles Create and apply block style templates that can be used for multiple types of blocks. Save time by sharing styles and applying them directly. When a block style is applied to a block, the base block style is applied first, then the additional applied blocks, if any. To create a block style template: Select the block style you want to save Click Save Block Style Template Click OK in the dialog box To apply a block style template: Apply a block style Click Edit > Block Styles > Template Select the block style template you want to use Click OK The block style template is applied to the blocks and is ready to be saved. Enhancement to the Layers Window Import and add to your drawings without the need for additional drawings. When you're working with layers, use the new Embed Layer command to drop in the layer or layers you want to import into your drawing, including just a single layer or layers from multiple drawings. To drop in a layer from a group: Select the layer or layers you want to import Press CTRL + E Drag the layer or layers you want to add Release the mouse button Drag
