prepare. be usable? Make sure you get a small digital camera, so you can record the movie and.
Learn about GoPro mounting and mounting locations for a standard GoPro camera. Tissues from a
human leg are creating the first working model of a bionic limb, and the first system to work by
manufacturing its own muscle mass from scratch. Scientists are growing new muscle cells with a
network of silicon tubes that fire signals to the cells, turning them into "smart muscles". "We
make muscle cells that have all the features they need to be strong, capable and functional,"
said Dr Thomas Noden from the University of Bath. "We could not achieve this before because we
could not make muscle cells, but now we can. "This opens up the door for the manufacturing of
muscle cells that will form the basis of replacement tissues, being organs in other words." The
tissue, modelled on a piece of tissue taken from a patient with a shattered fibula bone, is the
first to be made from a patient's own DNA, replicated and grown in a lab. "In the future, once
patients receive an artificial limb they will be able to use it and grow new muscles for a
better function, and the old ones will be replaced by new ones," said Dr Noden, lead author of
the study published in the journal Nature Biotechnology. The one-million-year-old limb tissue
was modelled on a section from a human leg that was torn while the patient was skiing. The leg,
previously used by a patient in the UK, was chosen because of the differences in tissue make-up:
the adipose tissue, which is the fatty substance covering the muscles, was removed and replaced
with a sugar-based material, while the dermis and the epidermis - layers of skin and a covering
- were also removed. Image copyright Bloomsbury Publishing/SPL Image caption The new muscle
cells had to be able to fire electrical signals The cells, which were taken from a patient that
was part of the study, were turned into muscle cells by introducing a gene that converted the
fat cells into muscle cells. Once they had the ability to fire electrical signals, the muscle
cells were then made into a network that fired signals f30f4ceada
