If I have try{ //some of code } catch (Exception e){ //do something } finally{ //some of code } my question is how to know what happens in each line of code? Since the condition of the try, except and finally is independent. I know the except catch was used to handle the exception occurred, but what happened inside the try, except? A: ...since the condition of the try, except and finally is independent... No, all three blocks are conditionally executed. The exception handling block is executed if the try block threw a checked exception, otherwise it is skipped. I know the except catch was used to handle the exception occurred... No, this means that the catch block is executed if any exception is thrown, not that the catch block is only executed if a particular exception is thrown. The finally block is always executed regardless of what happens in the catch block. If execution of the try block threw an exception, that exception was propagated to the finally block, where it will be caught (either by the catch block or, if there isn't one, by the closest enclosing try block). Here's a simple example, using a class that both throws an exception and rethrows it. The catch block is executed because an exception is thrown, so the finally block is skipped. public class TryThenCatchFinally { public void notGood() throws Exception {} public void good() throws Exception { try { notGood(); } catch (Exception e) { System.out.println("Caught exception in good method: " +
